

Simultaneous Pit and Waste Dump Schedule Optimization

Jim Butler
Minemax, Inc.

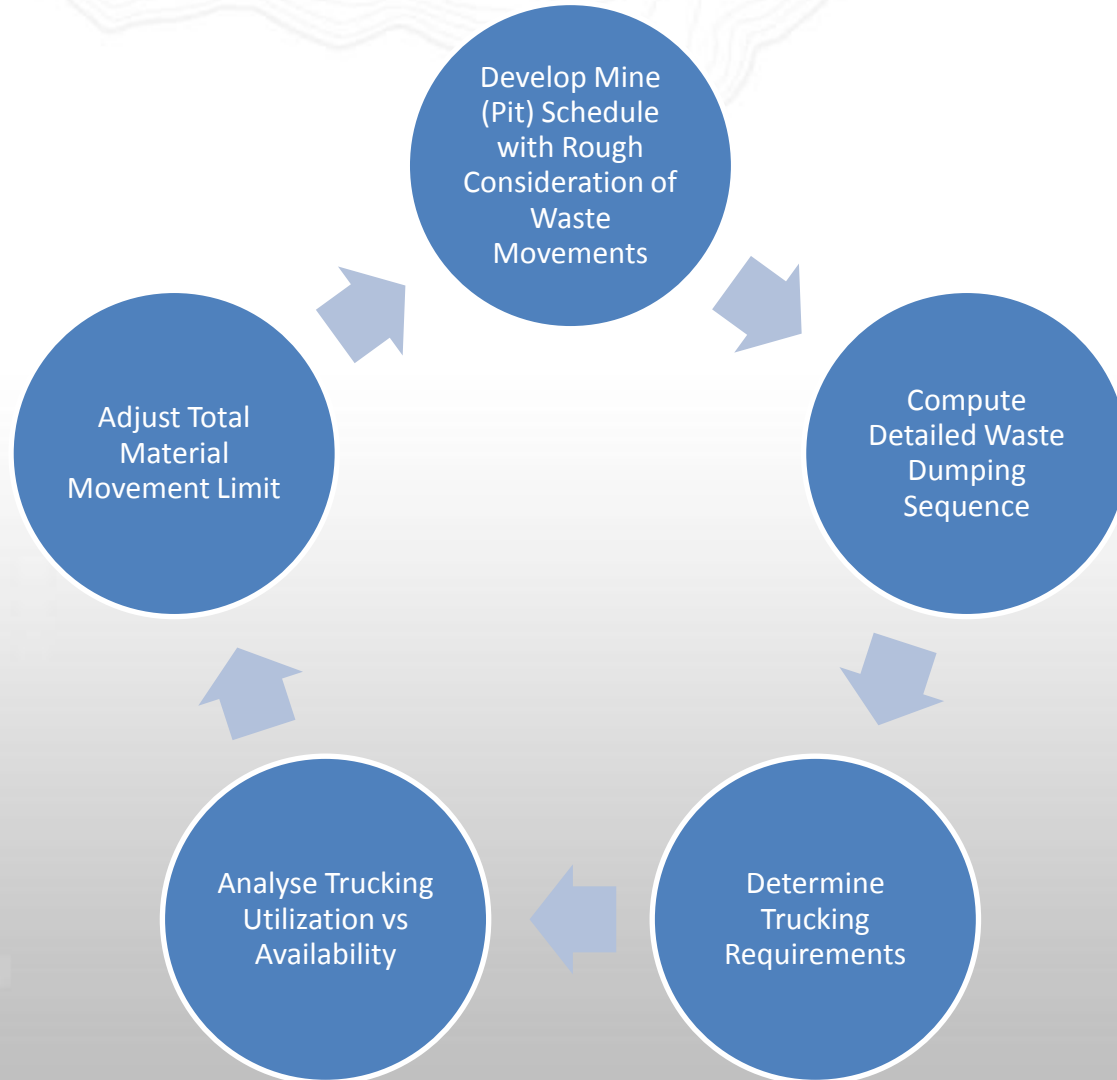

Tim George
Metal Mining Consultants, Inc.

SME Annual Meeting, Denver
Technology: Mine Planning and Optimization Session
February 26, 2013

- Current Practice in Pit and Detailed Waste Dump Scheduling
- Problems with Current Practice
- Formulation for Joint Pit and Detailed Waste Dump Scheduling
- Examples (iGantt, Tempo, Minemax Scheduler)
- Extensions (Multiple Waste Dumps, Heap Leach, Reactive Waste)
- Conclusion

Current Practice

- Basic Approach : Account for waste movement and dumping only through total material movement expressed in tonnes.
- Advanced Approach: Consider pit depth dependent trucking requirements on a per block basis

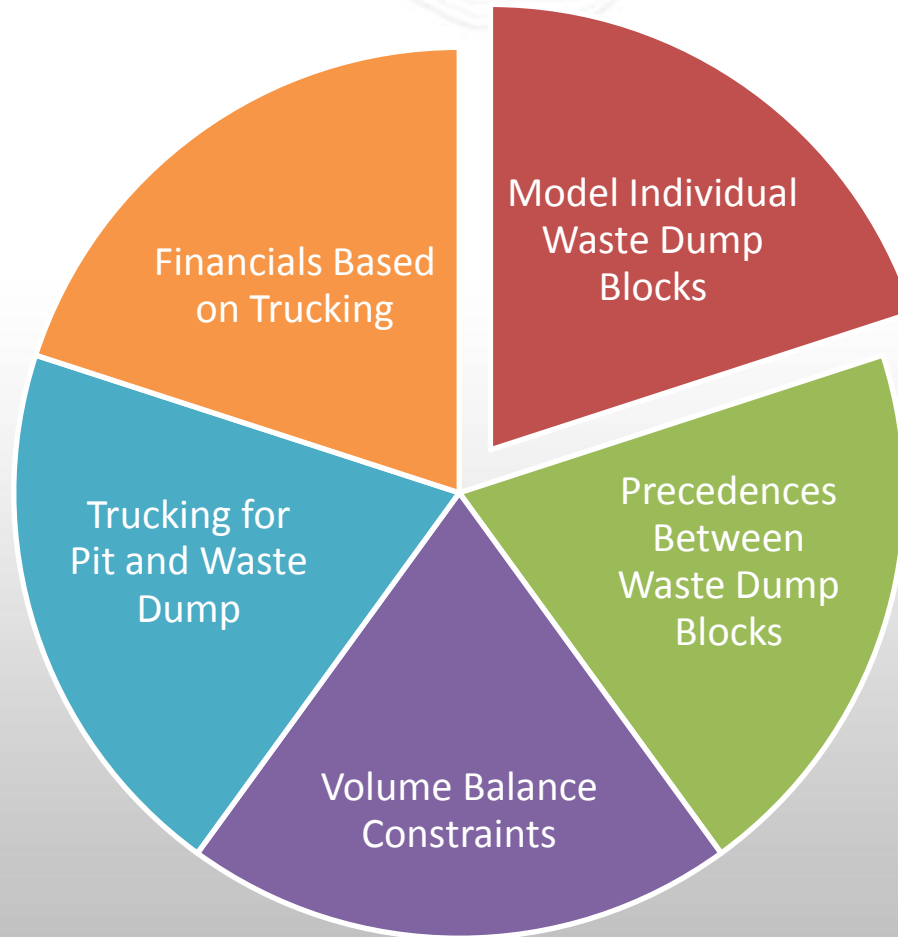

- Total Material Movement upper limit can be based on digging and/or hauling capability in tonnes per period.
- However, trucking requirements for a given tonnage to be mined can actually vary depending on where the material is mined from. Basic approach does not account for trucking requirements which vary with depth of mined block in the pit.
- Trucking requirements for waste can vary depending on where it is placed on the waste dump. Does not account for trucking requirements associated with detailed waste dumping.

- Based on cycle-times and truck capacities, model truck-hours and set a limit on available truck hours.
- Accounts for depth dependent trucking requirements for ore out of pit and to crusher.
- Accounts for depth dependent trucking requirements for waste out of pit but **not** to final resting place in waste dump.

- May use waste dump centroid as average distance for waste.
 - Results in over-estimating or under-estimating real trucking requirements.
 - With over-estimating there can be a loss in value
 - With under-estimating, the schedule is impractical

Pieces of the Puzzle for Proposed Formulation

- LP formulation can be viewed as a matrix with columns as decision variables and rows as constraints using decision variables
- In mine scheduling, use proportion of block to be mined in a period as decision variable : B_{ij} is a variable with a range between 0 and 1 representing the proportion of block i mined in period j
- Blocks can have multiple quantities associated with them
 - e.g. Mill tonnes, Mining tonnes, Metal Tonnes
 - denote Q_{ik} as the k^{th} quantity in block i
- For each quantity and in each time period, we can specify minimum and/or maximum total quantities denoted by row names of QC_{kj} indicating total quantity k in period j

Linear Programming Matrix General Form

	B11	B12	B13	B14	B21	B22	B23	B24	
	v	v	v	v	v	v	v	v		
QC11	Q11				Q21					QMAX11
QC12		Q11				Q21				QMAX12
QC13			Q11				Q21			QMAX13
QC14				Q11				Q21		QMAX14
QC21	Q12				Q22					QMAX21
QC22		Q12				Q22				QMAX22
QC23			Q12				Q22			QMAX23
QC24				Q12				Q22		QMAX24

$$QMIN_{jk} \leq \sum_i B_{ij} Q_{ik} \leq QMAX_{jk}$$

LPMatrix: Mining and Milling Example

	B11	B12	B13	B14	B21	B22	B23	B24	
	150,000	130,000	100,000	60,000	-5,000	-4,700	-4,200	-3,500		
Mill1	2500									10,000,000
Mill2		2500								10,000,000
Mill3			2500							10,000,000
Mill4				2500						10,000,000
Mine1	2500				2500					80,000,000
Mine2		2500				2500				80,000,000
Mine3			2500				2500			80,000,000
Mine4				2500				2500		80,000,000

- B1 is 2500 tonnes of ore
- B2 is 2500 tonnes of waste

Model Individual Waste Dump Blocks

- A waste dump is divided into a number of horizontal lifts. Lifts are further divided into dump blocks.
- Include waste dump blocks into the LP similar to pit blocks

- Define precedences between waste dump blocks corresponding to practical waste dump construction

- Introduce waste dump volume (wdv) as a positive quantity for waste dump blocks and a negative quantity for pit blocks

- Specify wdv balance constraints for each period.

$$\sum_i B_{ij} Q_{ik} = 0$$

- Where k is the waste dump volume quantity

- Pit blocks use cycle times to calculate required truck hours to a common point of passage enroute to the waste dump
- Waste dump blocks use cycle times to calculate required truck hours from the common point of passage to the waste dump block
- Specify truck hours availability constraints for each period.

$$\sum_i B_{ij} Q_{ik} \leq QMAX_k \quad \text{Where } k \text{ is the truck hours quantity}$$

- Assign a cost/hour to trucking

- Modelling approach can be applied to any Ip-based mine scheduling solution which supports blocks with multiple quantities and constraints
- Example 1: iGantt
- Example 2: Minemax Scheduler
- Example 3: Tempo

iGantt Example: Activity Types

Activity Type Manager

Activity Type Tree

- Activity Type Tree
 - Mining (Mining)

LoadHaul and WasteDumping as Activity Types

iGantt Example: DumpVol Quantity

The screenshot shows the 'Project Attributes' dialog box with a table of attributes. The 'DumpVol' attribute is highlighted. An 'Edit Attribute' dialog box is open over it, showing the following configuration:

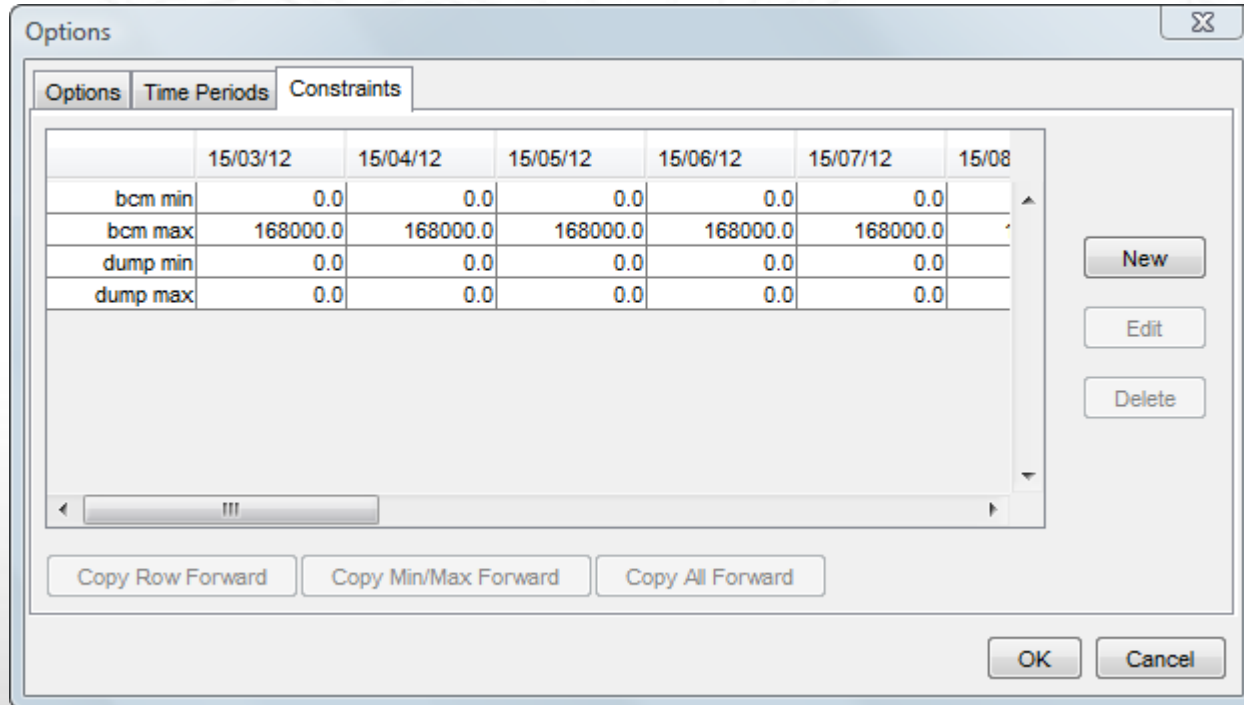

- Name: DumpVol
- Unit: bcm
- Type: Decimal
- Property / Grade
- Hidden Attribute
- Calculation:

```
if(@code@="LH",-1.0*#wastevol#,
if(@code@="WSTDMP",#wastevol#,0)
)
```
- Calculate when missing values

Buttons for 'New', 'Edit', 'Delete', 'Move Up', 'Move Down', 'OK', and 'Cancel' are visible.

Name	Unit	Type	Property	Hidden	Calculated
TotalVol	bcm	Decimal			
DigHours		Decimal			
HGTonnes	t	Decimal			
HGVol		Decimal			
Fe	%	Decimal			
Al2O3	%	Decimal			
SiO2	%	Decimal			
P	%	Decimal			
LOI	%	Decimal			
WasteTonnes		Decimal			
WasteVol		Decimal			
MappingID		AlphaNumeric			
UniqueName		AlphaNumeric			
FitchSeq		Decimal			
UniqueBench		AlphaNumeric			
DrillMetres	m	Decimal			
DigRate		Decimal			
Value		Decimal			
DumpVol	bcm	Decimal			
DrillHrs		Decimal			
Drill Cost	\$	Decimal			
Loading Cost	\$	Decimal			
CycleTime		Decimal			
TkHrs		Decimal			
TkCost		Decimal			

DumpVol Quantity
LoadHaul takes -ve values
WasteDumping takes +ve values

The screenshot shows the 'Options' dialog box with the 'Constraints' tab selected. The table below displays constraint values for 'bcm min', 'bcm max', 'dump min', and 'dump max' across dates from 15/03/12 to 15/08. The 'dump min' and 'dump max' values are all set to 0.0, indicating a total DumpVol balance of zero.

	15/03/12	15/04/12	15/05/12	15/06/12	15/07/12	15/08
bcm min	0.0	0.0	0.0	0.0	0.0	0.0
bcm max	168000.0	168000.0	168000.0	168000.0	168000.0	168000.0
dump min	0.0	0.0	0.0	0.0	0.0	0.0
dump max	0.0	0.0	0.0	0.0	0.0	0.0

Buttons: New, Edit, Delete, Copy Row Forward, Copy Min/Max Forward, Copy All Forward, OK, Cancel

Total DumpVol balance set to be exactly zero
(-ve from LoadHaul, +ve from WasteDumping)

The image displays a 3D visualization of a waste dump model. The model is composed of multiple layers of material, each represented by a different color. The layers are stacked on top of each other, forming a large, irregular shape. A central pit or depression is visible, filled with a blue material. The overall structure is complex and multi-layered, illustrating the 3D by Time concept.

- Any number of waste dumps (e.g. short haul, long haul) can be set up
- Each waste dump uses a common waste dump volume quantity
- Single multi-period optimization will choose alternative waste dumps to balance trucking over life of mine

- Introduce a heap leach dump volume quantity in addition to the heap leach ore tonnes quantity
- Define heap leach locations as lifts or blocks similar to a waste dump
- Heap leach locations contribute to heap leach dump volume quantity
- Blocks scheduled to heap leach contribute to both heap leach ore quantity and heap leach dump volume quantity
- Define volume balance constraints for heap leach dump volume quantity

Containing Reactive Waste

- Introduce reactive and non-reactive wdv quantities which each have their own volume balance constraints
- Internal dump blocks and in-pit reactive waste blocks contribute to reactive wdv quantity
- External dump blocks and in-pit non-reactive waste blocks contribute to non-reactive wdv quantity

- Introduced a generic way to model joint pit and detailed waste dump schedule optimization
- Implemented modelling technique in 3 of Minemax's schedule optimization solutions
- Outlined extensions for multiple waste dumps, heap leach and reactive waste
- Modelling technique can be applied to any lp-based mine schedule optimizer that models multiple quantities on a block
